

# Product Requirements Document (PRD)

---

**Product:** RSG Policy Reconciliation

**Platform:** Zoho Creator

**Customer:** Risk Solutions Group (RSG)

**Version:** 1.0

**Date:** 2026-08-18

**Owner:** Lamar (Operations / Producer)

**Builder:** Zia AI (Zoho Creator)

**Status:** Approved for Phase 1 build

---

## 1. Problem

RSG's policy truth lives in **NowCerts (AMS)**. Accounts and deals live in **Zoho CRM**. Renewals and ops state live in **Hermes / Supabase**. Those copies drift.

Today there is no single desk that:

- compares AMS vs CRM vs the renewal worklist on every policy
- explains *why* they disagree (verdict)
- scores how trustworthy the comparison is (0-100)
- opens an exception with an SLA instead of a Slack guess
- classifies cancellations (Non Pay vs Rewrite vs Insured Request vs Underwriter)
- links rewrites instead of treating them as lost business

The agency cannot scale to the \$1M premium north star if Gretchen and Lamar reconcile the book by hand.

## 2. Product statement

Build a Zoho Creator application named **RSG Policy Reconciliation** (`rsg_policy_reconciliation`) that is the **reconciliation workspace** for the in-force and recently cancelled book.

It is **not** a CRM. It is **not** an AMS. It does **not** book commissions.

For every policy it must emit:

1. Exactly one of **12 verdicts**
2. An integer **confidence score 0-100**
3. A written **recommendation**

4. An **Audit\_Exception** when the verdict is not `clean_match` (or confidence < 80, or premium delta exceeds the hybrid threshold)

### 3. Goals

| ID | Goal                                             | Measure                                                                |
|----|--------------------------------------------------|------------------------------------------------------------------------|
| G1 | One working row per AMS policy GUID              | Unique <code>NowCerts_Policy_GUID</code> on <code>Policy_Master</code> |
| G2 | Deterministic recon, not an LLM at runtime       | <code>Deluge thisapp.recon.verdict / score</code> only                 |
| G3 | Cancellation class always present on cancel      | Save blocked if class empty (except import seeds)                      |
| G4 | Rewrites linked, not double-counted              | <code>Rewrite_Of / Successor_Policy_Number</code>                      |
| G5 | Stale renewals visible same day in 30-day bucket | <code>stale_renewal_queue</code> + CSR view                            |
| G6 | No silent writes                                 | CRM update only with approval gate; <b>zero</b> NowCerts writes        |

### 4. Non-goals

- Creating Zoho CRM Accounts
- Writing NowCerts / Momentum (binds, endorsements, insured inserts)
- Commission ledger / money booking (Hermes `commission_ledger` stays SoR)
- Client-facing portal
- Inventing premiums, policy numbers, GUIDs, or carrier quotes
- A second 0–100 *renewal risk* score (Risk\_Status stays SAFE / AT\_RISK / CRITICAL / RENEWED / LAPSED)

### 5. Users

| Persona  | Creator role           | Jobs to be done                                                                       |
|----------|------------------------|---------------------------------------------------------------------------------------|
| Lamar    | Admin / recon-approver | Run recon, approve CRM drafts, close High/Critical exceptions, see Tier A money drift |
| Gretchen | CSR                    | Classify cancels, work stale renewals, resolve Low/Medium exceptions, add notes       |
| Hermes   | Integration user       | Scheduled CRM pull; cannot set <code>Approved_To_Push</code>                          |

## 6. User stories

1. **As Lamar**, I run daily recon at 6:45am ET and see counts by verdict, not a dump of every policy.
2. **As Gretchen**, I open CSR Queue and only see Low/Medium exceptions assigned to me.
3. **As Gretchen**, when a policy is Cancelled I must pick Non Pay, Rewrite, Insured Request, Underwriter, or Other before save.
4. **As Lamar**, I never want Creator to push CRM until I set Approved\_To\_Push, Approved\_By, and Approved\_At (within 24 hours).
5. **As Gretchen**, opening a renewal record does **not** count as a touch; only real field edits stamp Last\_Touched\_At.
6. **As Lamar**, if AMS has a policy and CRM does not, the app drafts a Policy create and **does not** create an Account.
7. **As either**, if two Policy\_Master rows share a Policy\_Number, verdict is duplicate\_policy — uniqueness is **not** enforced on Policy\_Number so the duplicate can be stored and flagged.

## 7. In-scope product surface

### 7.1 Five forms (exact API names, this order)

1. Policy\_Master — working copy (67 fields; see field CSV)
2. Policy\_Status\_History — immutable status audit
3. Renewal\_Queue — Project 85 style worklist
4. Policy\_Audit — one row per run per policy
5. Policy\_Audit lookup child: Audit\_Exceptions — SLA work items

Do not add a sixth form in Phase 1.

### 7.2 Twelve verdicts (do not rename)

duplicate\_policy → pending\_sync → rewrite\_detected → status\_mismatch → financial\_discrepancy → missing\_in\_crm → missing\_in\_ams → stale\_renewal\_queue → stale\_crm → cancel\_reason\_gap → lineage\_orphan → clean\_match

First match wins.

### 7.3 Confidence

Start at 100. Subtract per scoring table S1–S25. Integer. Floor 0, ceiling 100. Write Score\_Breakdown.

## 7.4 Financial rule

Flag `financial_discrepancy` when `abs(Premium - CRM_Premium) ≥ $25` **OR** `abs(percent) ≥ 1%`. `Agency_Fee` is not premium.

## 7.5 Renewal risk (separate from confidence)

Premium increase first, then timing: >15% CRITICAL, ≥5% AT\_RISK; else ≤30 days CRITICAL, 31–90 AT\_RISK, else SAFE.

## 8. Phased delivery

| Phase | Product increment                                                         | Zia stop rule       |
|-------|---------------------------------------------------------------------------|---------------------|
| 1     | Schema, picklists, lookups, permissions, status-history hook, Policy_Tier | <b>STOP. Wait.</b>  |
| 2     | Verdict + score + rewrite + Run Recon button + sample seeds               | Stop for acceptance |
| 3     | Daily/weekly schedules, SLA sweep, views, Recon Desk, email               |                     |
| 4     | Zoho CRM read; gated write stub                                           |                     |
| 5     | Optional Hermes health HTTP                                               |                     |
| 6     | Zoho Analytics + harden                                                   |                     |

## 9. Success metrics (product)

- Phase 2: all 14 seed policies in `sample_records.json` match expected verdict **and** confidence.
- Phase 3: no second Open exception for the same policy + verdict.
- Phase 4: Deluge contains no `zoho.crm.createRecord("Accounts")`.
- Production: Gretchen cannot resolve High/Critical; cannot set `Approved_To_Push`.

## 10. Constraints Zia must obey

1. NowCerts wins policy facts (premium, dates, carrier, status).
2. Unknown AMS status → `Sync_Status=Error`, do not invent a picklist value.
3. Mid-term cancel: keep `Expiration_Date`; store cutoff in `Cancellation_Date`.
4. Pending Cancel is **not** auto-excluded from the renewal queue (`needs_verification`).
5. Non Pay is not a rewrite unless a replacement policy is identified.
6. Time zone America/New\_York. Currency USD.

## 11. Dependencies

Field-level create lists: `forms_*.csv`, `picklists.csv`, `views.csv`, `workflows.csv`, `deluge/*.dg`. Those files are part of this PRD's data appendix (also inside `ZIA_UPLOAD.xlsx`).

## 12. Open questions (do not invent answers)

- Live Zoho CRM Policies module API name after org create (may be CustomModuleX). Confirm before Phase 4.
- Gretchen and Lamar Zoho user emails for Owner assignment (placeholders `gretchen` / `lamar` until replaced).
